USER’S MANUAL

Have a technical question?

Americas:

If you have questions, or require technical service, please contact our trained service technicians at:

1-314-679-4200 ext. 4782

Monday – Friday 7:30 am to 4:15 pm CST

Visit our web site at www.mityvac.com for new products, catalogs, and instructions for product use.

Need service parts?

To order replacement or service parts, visit us online at www.mityvacparts.com or call toll free 1-800-992-9898.

Specifications:

Reservoir Capacity (w/ pump): 5 quarts/1.2 gallons/4.5 liters
Maximum Pressure: 25 psi/1.7 bar/170 kPa

It is the responsibility of the user of this equipment to read this user’s manual entirely, and understand the safe and proper use and application of this equipment.

STANDARD ACCESSORIES

MVA570 – Fluid Dispensing Wand
MVA575 – Fluid Dispensing Hose
822753 – Hanging Hook
MVA6839 – Pressure Bleed Reservoir
MVA6850 – Pressure Bleed Adapter Kit

OPTIONAL ACCESSORIES

MVA571 – Fluid Storage Lid
824926 – Replacement Hose

MVA576 – 1-Gal. Reservoir with Storage Lid

See following page for individual adapters and their applications.

</table>
This equipment is designed and intended for use as a means to dispense fluid for pressure bleeding hydraulic brake and clutch systems. It utilizes a manual pressure pump to build pressure in the reservoir. The pressure forces fluid to dispense out of the reservoir through a fluid pickup tube. The output of the fluid pickup tube is connected to a quick-change coupler, to which a variety of accessories can be attached to control or direct the flow of fluid according to the intended application.

The equipment should never be operated above a safe level of pressure depending on the application. A gauge is installed to indicate the pressure in the reservoir, and should be observed regularly to ensure the pressure remains at or below what is recommended for the application.

Precautions
This equipment is designed for servicing a variety of vehicles in a safe, convenient manner. However, differences in vehicle makes and models may make it impossible to use this equipment as it is intended. Do not attempt to force the use of this equipment on an application for which it is not designed to perform.

The procedures documented in this manual are to serve as guidelines for the use of this equipment. In addition to these guidelines, always follow the manufacturer’s recommended procedures when servicing each unique vehicle.

The use of this equipment is simple and straightforward if you follow the instructions. However, always keep in mind that you are working with a system that may be under pressure, with fluid that is just waiting to be expelled. When operating this equipment, use common sense, and always stop to think before disconnecting a hose or other component.

• This equipment is intended only for professional use by personnel trained in performing the service func-
**INSTRUCTIONS FOR USE**

**WARNING:** Hydraulic/brake fluid is hazardous and corrosive. Take precautions to protect painted surfaces and skin from exposure, and read and follow the fluid manufacturer’s warnings and instructions.

1. Park the car, set the parking brake, and turn off the engine.
2. Open and secure the hood.
3. Locate the brake or clutch master cylinder and remove the cap.
4. Extract as much used hydraulic fluid from the master cylinder reservoir as possible, and refill it with new fluid.
5. Select the appropriate master cylinder pressure bleed adapter and install it securely onto the master cylinder reservoir.
6. Before adding fluid to the Dispenser, connect the fluid dispensing hose to the female quick-connect coupler extending from the reservoir. Ensure the coupler sleeve snaps forward to lock the connection.
7. Connect the other end of the fluid dispensing hose to the male quick-connect coupler on the master cylinder pressure bleed adapter. Ensure the coupler sleeve snaps forward to lock the connection.
8. Ensure the shutoff valve is open, and operate the manual pump to pressurize the system to 10 psi (0.7 bar).
9. Watch the pressure gauge to ensure there are no leaks. If the pressure drops, relieve the remaining pressure in the system by tilting the pressure relief knob located on the lid, remove and retighten the lid from the dispensing reservoir and the adapter on the master cylinder reservoir, and recheck the system for leaks.
   **WARNING:** Serious injury and/or equipment damage can occur if the lid is removed from the dispensing unit or the adapter from the master cylinder, without first relieving the system pressure.
10. Once you’ve proven all connections are secure and the master cylinder adapter does not leak, remove the lid with pump from the dispensing unit and add up to 2 quarts (2 liters) of a manufacturer’s recommended new hydraulic fluid from a sealed container.
11. Reinstall the lid with pump and tighten it securely.
12. Consult a service manual to determine the recommended bleed pressure and the proper bleeding sequence for the vehicle being serviced.
13. Observing the pressure gauge, operate the pressure pump to achieve the recommended pressure.
14. Connect the bleed reservoir to the bleed screw of the first cylinder to be bled.
15. Open the bleed screw. Allow fluid to flow out until only clear new fluid with no visible air bubbles is streaming from the screw, and then re-tighten the bleed screw to the manufacturer's recommended torque.
16. Perform the same procedure on all remaining bleed screws. Operate the pressure pump as required to maintain adequate pressure.
   **Note:** Do not allow the dispensing unit and master cylinder reservoir to run dry. Use the pressure relief valve to relieve the pressure and add new fluid if necessary.
17. Once bleeding is complete, relieve the pressure in the reservoir and master cylinder by tilting the pressure relief knob located on the lid of the dispensing unit.
18. Close the fluid dispensing hose shutoff valve, and carefully remove the adapter from the master cylinder, being careful not spill any brake fluid.
19. Extract excess fluid or top-off the master cylinder as required, and replace the cap.
20. Dispose of any hydraulic fluid remaining in the Dispenser. Do not store hydraulic fluid in the reservoir. Clean the dispensing unit with denatured alcohol and store it properly.
21. Test the brake or clutch system for leaks before driving the car.
